

Aurora Relay Field Manual

Station Kestrel activation

Station Kestrel is part of the fictional Aurora Relay network.

Its activation sequence is LANTERN-54.

Do not confuse this sequence with Meridian habitat service tag LANTERN-45.

Aurora Relay Field Manual

Power configuration

Station Kestrel uses a 48-volt reserve battery during relay maintenance.

The reserve pack must be isolated before the activation sequence is entered.

A retired Harrier test unit used 41 volts; that value does not apply to Kestrel.

Aurora Relay Field Manual

Cold-weather inspection

In cold-weather service, Station Kestrel is inspected every 14 days.

Technicians record the inspection in the synthetic Aurora maintenance ledger.
